**DHF BEST PRACTICE GUIDES**
This publication is one in a series of guides addressing the major issues that should be considered when specifying, ordering or using the products it describes. It aims to provide the reader with a concise document which includes a summary of relevant sections from the new European product standards. The reader will then be in a position to seek further specialist advice where necessary and recognise GENUINE conformity to the new standards.

**BS EN 1125 - Panic exit devices**
Experience relating to escape from buildings and general safety have made it desirable that doors at final exits in public buildings, places of entertainment, shops, etc should be fitted with panic devices operated by a horizontal bar. The emphasis for products covered by this standard is on safe exit rather than security.

These standards provide details on product types, classification by use, test cycles, door mass, corrosion resistance, as well as definitions, product performance requirements, test apparatus, test methods and marking of products. In addition, the published standards include annexes illustrating the various points made through diagrams and supplementary text.

BSI publications can be obtained from BSI Customer Services, 389 Chiswick High Road, London W4 4AL

Email: cservices@bsi-global.com

**SCOPE - BS EN 179**
The main purpose of the performance requirements of this standard is to give safe and effective escape through a doorway with minimum effort and without prior knowledge of the device, i.e. for locked doors on escape routes where panic situations can be foreseen.

**CLASSIFICATION**
BS EN 1125 and BS EN 179 classify panic and emergency exit devices by using a 10 digit coding system. A similar classification applies to all building hardware product standards so that complementary items of hardware can be specified to, for instance, a common level of corrosion resistance, category of use, etc. Each digit refers to a particular feature of the product measured against the standard's performance requirements.

The DHF recommends the use of graphic icons to enhance clarity of information and has devised a system to facilitate assimilation of the various product classifications. Each feature within the product classification code is represented by an icon comprising four elements: Symbol, Grade/Type, Range/Options and Box:

The icon above is for a product which meets Grade 3 in the category of use classification, where EN 1125 and EN 179 stipulate only grade 3.

Full details on the DHF graphic icons system can be found at www.dhfonline.org.uk
DHF Best practice guide: Panic and emergency exit devices

**Digit 1**

**Category of use**

Only one category is identified, that being
- grade 3: high frequency of use by public and others with little incentive to exercise care.

**Digit 2**

**Number of test cycles**

Two categories of durability are defined:
- grade 6: 100 000 cycles
- grade 7: 200 000 cycles

**Digit 3**

**Test door mass**

Three categories of test door mass are identified:
- grade 5: up to 100 kg
- grade 6: up to 200 kg
- grade 7: over 200 kg

**Digit 4**

**Fire resistance**

Three categories of fire door resistance are identified:
- grade 0: Not approved for use on fire/smoke door assemblies
- grade A: Suitable for use on smoke door assemblies, subject to satisfactory assessment of the contribution of the panic/emergency device to the smoke resistance of specified smoke door assemblies
- grade B: Suitable for use on fire/smoke door assemblies, subject to satisfactory assessment of the contribution of the panic/emergency device to the fire resistance of specified fire/smoke door assemblies

Such assessments are outside the scope of this European standard (see EN 1634-1)

**Digit 5**

**Safety**

All panic and emergency devices have a critical safety function therefore only the top grade - 1 - is identified

**Digit 6**

**Corrosion resistance**

Two grades of corrosion resistance are identified according to EN 1670:
- grade 3: high resistance (96 salt spray hours)
- grade 4: very high resistance (240 salt spray hours)

**Digit 7**

**Security**

Products covered by BS EN 179 have 4 identified categories and generally have the opportunity of greater security against forced opening than devices covered by BS EN 1125.

BS EN 179
- grade 2: 1 000 N

BS EN 1125

Only one category of security is identified:
- grade 2: 1000 N panic devices are primarily for the operation of a door from the inside. Safety considerations will always be given priority over security.

**Digit 8**

**Projection of device**

Two grades are identified relating to the projection of the device from the door face:
- grade 1: projection up to 150 mm (large projection)
- grade 2: projection up to 100 mm (standard projection)

**Digit 9**

**Type of device**

Two categories are identified for each standard:

BS EN 179
- type A: emergency device with lever handle operation
- type B: emergency device with push or pull pad operation

BS EN 1125
- type A: panic device with push bar operation
- type B: panic device with touch bar operation

**Digit 10**

**Field of application**

EN179
A: Outward opening
- Single & double exit doors; active & inactive leaf
B: Outward opening
- Single exit door only
C: Outward opening
- Double exit door, inactive door
D: Inward opening
- Single exit only

EN1125
A: Outward opening
- Single & double exit doors; active & inactive leaf
B: Outward opening
- Single exit door only
C: Outward opening
- Double exit door; inactive door
DHF Best practice guide: Panic and emergency exit devices

• EXAMPLE:
The following marking denotes a panic exit device tested to 200 000 operations for a door mass up to 200 kg, suitable for fire door use with very high corrosion resistance with standard bar projection for use on single & double doors.

3 (3) [0/1] 1 (1) 4 (3/4) 2 (1/2) A (ABCD/D) B (a) BCE 7 (6/7) 6 (5/6) 5 (4/5) 2 (1/2)

• MARKING
Visible on the product when fitted:-
(a) Manufacturer’s name or trademark or other means of positive identification
(b) Identification number of the certification body
(c) CE mark symbol (as detailed in annex of standard)

Other markings which must be visible before fitting:
(d) Classification code for the product
(e) The number and year of the European standard
(f) The month and year of final assembly by the manufacturer, which can be in a coded form

• CE MARKING
Panic and emergency exit devices intended for use on escape route doors are covered by a Construction Products Directive mandate issued by the European Commission. Consequently, these standards are regarded as “harmonised” standards and compliance with them, supported by suitable evidence, allows for the application of the CE mark.

As panic and emergency exit devices have a critical safety function, application of the CE mark will require the involvement of a notified certification body to provide verification of the compliance claims. This will involve initial type testing of the product to either EN 1125 or EN 179, initial inspection of the manufacturer’s factory production control and continuing surveillance and approval of the factory production control. On satisfactory fulfilment of these tasks, the notified body issues an EC Certificate of Conformity which then permits the manufacturer to declare compliance and affix the CE marking to his product.

The standard requires the following additional information to accompany the CE marking:-

• the identification number of the notified certification body
• the name or identifying mark of the manufacturer
• the registered address of the manufacturer
• the last two digits of the year in which the marking was applied
• the number of the EC certificate of conformity
• reference to EN 1125:2008, or EN 179:2008, as appropriate
• the classification code of the product

Note that although the notified body has to be involved to verify the manufacturer’s claims, the manufacturer remains responsible for designing and producing the product, for affixing the CE marking, and for ensuring that the product meets the requirements of the directive.

• SPECIFICATION ISSUES
The decision as to which products are specified should be made on the basis of the building use and occupancy. Products incorporating a horizontal bar (BS EN 1125) to operate the exit device must be used in public buildings, places of public entertainment, shops and any other location where the building occupants do not have prior knowledge of the escape device and where a panic situation can be foreseen.

- Products incorporating a push or pull pad or lever handle to operate the exit device (BS EN 179) should only be used where building occupants are familiar with the emergency exit and its hardware and where a panic situation is not foreseen.

- If there is any doubt about the conditions relating to building occupancy, the DHF recommends that devices covered by BS EN 1125 should be specified.

- For safety reasons, the standard requires that the push bar of a type “A” panic device shall not protrude beyond either of the end supports. This means that for pairs of rebated doors, the traditional British designed “double panic bolt” cannot comply with the standard. An acceptable solution is for a single vertical panic bolt to be fitted on the “inactive leaf” and a panic latch on the “active leaf”.

- A grade 2 (standard projection) panic device should be used in situations where there is restricted width for escape or where doors are not able to open beyond 90°.

- Panic device push and touch bars should be installed to provide the maximum effective length but never less than 60% of the door leaf width.

Devices complying with these standards will either be sold complete, i.e. including all the necessary components, or, if this is not done, the manufacturer must identify, in the product information supplied with the device, all the components and accessories which have been tested as compatible with the product.

Dogging devices or hold back features on exit devices cannot be used on fire doors, unless the hardware has been tested on a fire door in the unlatched condition. It is also important that the door to which the hardware is fitted has been tested in the unlatched condition.

EN 179:2008 includes devices for inward opening single doors. These devices were added to the standard to deal with situations where an outward opening door would risk causing an obstruction in a corridor.
In addition to ensuring that products satisfy the requirements of this standard, other factors should be taken into consideration when selecting lever handles and knob furniture. These not only include sourcing products from a reputable manufacturer, but also quality assurance, support services and unequivocal conformity.

**QUALITY ASSURANCE**

The internationally recognised standard for quality assurance, BS EN ISO 9000 provides confidence that the products are being manufactured to a consistent quality level.

Companies displaying this symbol are registered under the BSI Registered Firm Scheme.

**SUPPORT SERVICE**

The correct specification and installation of panic and emergency exit devices is essential to ensure that they are able to operate efficiently within the performance levels described in this standard. Specialist advice is available from ABHM members in support of their products from specification stages through supply to effective operation on site.

**CONFORMITY**

Conformity to the standard must be clearly and unequivocally stated. Such phrases as “tested to ...”, “designed to conform to ...”, “approved to”, are not sufficient. To avoid misleading or confusing claims it is recommended that one of the following phrases is used when stating conformity.

“This product has been successfully type-tested for conformity to all of the requirements of (BS EN 1125 & BS EN 179: 2008), including the additional requirement for (fire/smoke door use*). Regular audit testing is undertaken. Test Reports and/or Certificates are available on request.”

* Add as appropriate.

It is recommended that an ARGE Declaration of Compliance is also completed, as this gives a clear and unambiguous method of demonstrating test evidence and compliance.
